Problem Statement: Enhancing Creative Content Generation Using Adaptive Generative AI

SCORES Analysis Scores

CODE Code Metrics

Metric	Value
Total Files	1
Lines of Code	2,753,009
Languages	TypeScript: 65.7%, JavaScript: 22.1%, CSS: 11.9%, HTML: 0.3%
Frameworks	TypeScript, PostgreSQL, Vite, React, CSS, Supabase, Express, Node.js, WebSocket
Architecture	Clean Architecture

Engineering Maturity: Tests (6 files)

TEAM Contributors

Total Commits: 689

Contributor	Commits	Lines Changed	Share
Abhay Kumar	452	+1444779/-361195	65.6%
Chhaya AI	230	+735604/-183901	33.4%
Chaos_Immortal	7	+22024/-5506	1.0%

Individual Student Scores (Based on contribution, effort, and code quality)

Student	Commits	Contribution %	Effort	Quality	Final Score
Abhay Kumar	452	66%	66	76	68
Chhaya AI	230	33%	33	43	35

INTEGRITY Commit Integrity & Deductions

Fake Commits: **118** (17.1%) | Commit Health: **At Risk**

AI Tools Detected in Commit History: **gemini**

Example Flagged Commits:

1. b73e070 - Feat: Initial infrastructure for adaptive context
Reason: Empty Commit (No Changes), Empty Commit (No Changes)
2. d40fa53 - Feat: Initial infrastructure for adaptive context
Reason: Empty Commit (No Changes), Empty Commit (No Changes)
3. f7fb7dd - Refactor: Optimized token usage in generator prompt
Reason: Empty Commit (No Changes), Empty Commit (No Changes)
4. 3cd42fe - Refactor: Optimized token usage in generator prompt
Reason: Empty Commit (No Changes), Empty Commit (No Changes)
5. b0af387 - Feat: Added support for multi-GPU inference in loc
Reason: Empty Commit (No Changes), Empty Commit (No Changes)

AI AI Analysis & Feedback

AI-Generated Content: **0.0%** | Verdict: **Beta Ready**

Features Implemented:

- User authentication and session management
- Landing Page
- Text Workspace for story generation
- Audio Workspace for music generation
- Image Workspace for image generation
- Feedback Page for user inputs

Positive Feedback:

The Chhaya project has an engaging and well-structured user interface, making the navigation among different creative workspaces user-friendly. The use of generative AI for creating diverse media outputs is innovative. Additionally, the backend's real-time capabilities with WebSocket enhance responsiveness and interactivity.

Areas for Improvement:

The application would benefit from improving the adaptive learning features to better utilize user feedback in future content generation. Further integration of inputs across various media formats will elevate the overall user experience. Additionally, enhancing documentation and error handling is essential for more stable deployment.

FEATURES Feature-by-Feature Analysis

User authentication - **Fully Implemented** | Quality: Good

Good: User registration and session management are fully operational, allowing secure access to the features.
Needs improvement: Enhance password recovery options and two-factor authentication for added security.

Text Workspace for story generation - **Fully Implemented** | Quality: Excellent

Good: Users can input themes and tones, generating creative story outputs.
Needs improvement: Integrate real-time suggestions while inputting themes.

Feedback Page for user inputs - **Partially Implemented** | Quality: Average

Good: Users can submit feedback on generated content.
Needs improvement: Establish a mechanism for the AI to learn visibly from the user feedback submitted.

PRODUCT Product Analysis

Value Proposition: Chhaya allows users to engage in creative content generation leveraging AI, adapting to user inputs and preferences.

Target Users: Content creators, marketers, and educators seeking innovative ways to produce creative material.

Competitive Advantage: Weaves together media types and employs user feedback for continuous improvement, setting it apart from standard tools.

Market Readiness: Beta Ready

IDEAS Suggested New Features

1. Adaptive learning mechanism - Priority: Critical

Why: This would significantly improve the quality of generated content based on real user feedback.

How: Use machine learning models to analyze feedback patterns and adjust generation algorithms.

2. Error handling for generation processes - Priority: High

Why: Robust error handling will improve user experience and operational reliability.

How: Implement try-catch blocks around generation logic to capture and respond to errors effectively.

SUMMARY Overall Recommendation

Prioritize the development of adaptive learning features and improve documentation quality to enhance usability. Focus on achieving better integration among media types to meet market needs effectively

SECURITY Security Analysis

Security Score: 81.0/100 (Secrets: 98.0, Practices: 56.0) | Secrets Detected: 1

Detected Secrets:

1. Google API Key [MEDIUM]

File: replacements.txt (Line 1) | Confidence: 100%

Security Best Practices:

- NO Rate Limiting
- NO Authentication
- NO Authorization
- OK Input Validation
- NO CORS Configuration
- NO Security Headers
- NO SQL Injection Prevention
- NO XSS Prevention
- NO CSRF Protection
- NO Password Hashing

Security Recommendations:

1. Implement Authorization [Priority: 9/10]

Authorization is not implemented in this codebase. Check user permissions before allowing actions (e.g., only admins can delete data)

2. Implement SQL Injection Prevention [Priority: 9/10]

SQL Injection Prevention is not implemented in this codebase. Use safe database queries to prevent SQL injection attacks (hackers can't steal your data)

3. ? Secret Found in Code [Priority: 8/10]

Your code contains sensitive information that should be kept private. This is a security risk! Found in 1 location(s).

4. Implement Authentication [Priority: 7/10]

Authentication is only partially implemented (found in 1 file(s)). Add user login/authentication so only authorized users can access your app

5. Implement XSS Prevention [Priority: 7/10]

XSS Prevention is not implemented in this codebase. Clean user input before displaying it to prevent XSS attacks (malicious scripts)
... and 5 more
